Established in 1961, we are one of North America’s leading suppliers of masonry reinforcing and tie systems. Our products have been developed in accordance with accepted building practices and meet or exceed local, regional and national codes and standards. **Blok-Lok** remains committed to setting the standard in the industry. Please call us anytime for technical assistance or recommendations.

**Mechanical Repair Anchors for Stabilizing Veneers**

**TORQ-LOK**

The Torq-Lok mechanical anchoring system is an easy to use and cost effective method to re-connect existing veneers to various substrates. The process eliminates the need to tear down an existing veneer by providing a corrosion resistant tie assembly. The components are manufactured of AISI Type 300 series austenitic stainless and ASTM Type 360 brass. The combination provides for long-term durability and structural stability for the design life of the structure.

The 500 and 510 Series system consists of brass expansion elements that are situated in the veneer and backup segments of the wall system being rehabilitated. They are torque activated which provides a method of inspection for both the façade and backup connection. The two independent expanders are connected via a stainless steel shaft and hardware.

The 520 and 530 Series System utilizes the brass expander as a connection means for the outer wythe. The backup has either a lag thread or self-drilling/self-tapping screw on a stainless steel shaft. The installation accuracy can be inspected via torque for both connectors in the two wythes.

Once installed, the anchors resist veneer loading in both compression and tension. The design of the system provides two independently activated expanders that do not create tension between wythes. Basically, the Torq-Lok system replicates a wall tie’s performance. That is, live loads on the veneer are transferred to the backup thereby stiffening the veneer and minimizing crack potential. All Torq-Lok anchors are installed at “T” joint or bed joint locations, concealed with a mortar patch or sealant, and have no exposed hardware.

The Torq-Lok anchors are manufactured of applicable ASTM materials. They are available in a variety of lengths, and can be made to special lengths upon request.

**Basic Applications**

Use where facades have missing or corroded wall ties or anchors. Can be applied at peripheral areas that are bulging or around areas that are to be removed. Use as a replacement tie for broken or cracked headers in composite walls. Use in high stress areas, which require load resistance greater than provided by typical wall ties. Can also be applied or modified to reattach thin clad stone to various backup materials.
Advantages

- **Quality Control**
  Independent activation provides for methods to inspect immediately upon installation or at a later date by using a torque measuring technique and equipment.

- **No Lateral Tensile Stress**
  Does not pull the two wythes of material together.

- **No Assembly Required**
  Anchors are factory assembled and are installed as a complete unit in the field.

- **Versatile**
  Available in multiple configurations for various backup building materials and cavities.

- **Mechanical Lock**
  Positive connection technique for questionably soft material or dense building material.

- **Simple to Install**
  Designed to be installed with screw guns or by hand using standard sockets or Blok-Lok installation tools.

- **Corrosion Resistant Materials**
  Provides for long-term durability and dependability in most normal corrosion environments.

- **Flexible**
  Provides for in-plane ductility while resisting out of plane loads.

- **Performance**
  Capable of supplying ultimate tension and compression capacity 10-20 times typical wall tie performance.

Anchor Spacing

Torq-Lok anchors are typically installed at one anchor per 2 - 5 square feet of veneer area to be retrofitted. It is recommended that you refer to your local building codes and standards for spacing condition requirements of wall ties and anchors for appropriate compliance.

Performance

Each construction site is unique and the appropriate use of this product is the responsibility of the engineers, architects, and other professionals who are familiar with the specific requirements of the project. The data reflects results of lab, field and in-house tests and are provided as a guideline for the designer. Site testing is encouraged for verification of load capacity.

Installation Procedure and Criteria for Masonry and Concrete

1. Select proper anchor length based on wall make-up.
2. Drill appropriate hole at mortar joint (preferably “T” location) using a rotary hammer or hammer drill. Rotary only in soft material.
3. Drill 1/2" hole through outer wythe of material.
   • For solid back-up, continue 1/2" hole drilling to a 2 – 2 1/2” depth minimum. (or total depth 1/2” deeper than anchor length)
   • For Hollow Back-up, drill a 3/32” diameter hole through the cavity face of the inner wythe material.
4. Blow out excess drill lines.
5. Assemble threaded portion of complete anchor assembly to the setting tool. Hex bolt on the setting tool must be fully seated, thread anchor shaft into setting tool until it stops.
6. Insert entire assembly into drilled hole until it bottoms in the solid back-up, or until the washer contacts inner cavity face of hollow back-up.
7. Rotate tool clockwise and tighten back-up anchor 50 – 100 in-lbs, remove setting tool.
8. To remove setting tool, loosen bolt head while holding setting tool firmly, spin off by hand.
9. Slide socket drive tool over hex segment of setting tool on to the hex nut of the anchor and tighten to 50 – 100 in-lbs.
10. Remove socket and plug hole.

Installation Procedure and Criteria for Metal or Wood Stud

1. Select proper anchor length based on wall make-up.
2. Drill appropriate hole at mortar joint at stud location using a rotary hammer or hammer drill. Rotary only in soft material.
3. Drill 9/16" hole through outer wythe of material.
4. Confirm stud location and blow out excess drill lines.
5. Assemble threaded portion of complete anchor assembly to the Screw Gun setting tool. Hex bolt (7/16" hex) on the setting tool must be fully seated, thread anchor shaft into setting tool until it stops.
6. Insert entire assembly into drilled hole until the pointed end of the shaft makes contact with the stud, firmly trigger screw gun until anchor is seated.
7. Remove socket drive and rotate tool counterclockwise to loosen and remove from anchor.
8. To torque check installed anchor in back-up, leave setting tool attached as a means to connect to a torque wrench, metal stud = 25 – 50 in-lbs, (50 - 100 in-lbs in 16 ga.) and wood stud = 35 – 100 in-lbs, remove setting tool.
9. Using a 5/16" deep well socket, tighten hex nut (with screw gun or by hand) of the anchor to 50 - 100 in-lbs.
10. Remove socket and plug hole.

Catalog # | Shaft # | Shaft L. | Cavity Range
--- | --- | --- | ---
505054 | 502054 | 5.5" | 0 – 1”
505064 | 502064 | 6.5" | 0 – 2”
505074 | 502074 | 7.5" | 0 – 3”
505084 | 502084 | 8.5" | 0 – 4”
505094 | 502094 | 9.5" | 0 – 5”
